

Experience

Bloomberg LP

Developer Experience | Team Lead

Jan 2025 - Present

- Technical Lead and Line Manager of six-person cross-region team (UK and US)
- Stabilising, upgrading and making performant the company's CI infrastructure serving over 10,000 engineers and millions of weekly builds.
- Defining the company's story around container image lifecycles, from build to distribution.
- Working with a wide array of technologies, including Linux, Terraform, Python, Go, Java, Podman, Docker, Buildkit, OIDC, and more.

Developer Experience | Senior Software Engineer

Feb 2022 - Dec 2024

- Scaled and stabilised company-wide CI/CD system, helping transform it from unreliable to widely adopted and high-performing – processing millions of builds a week.
- Worked with complex distributed systems involving a large number of technologies, such as Python, Go, Kafka, GraphQL, Podman, Docker (and compose), Bubblewrap, CNCF buildpacks.
- Successfully helped mentor multiple people inside the team and across the wider org.
- Introduced Python, Go, and Node.js buildpack build systems into the CI platform.
- Led telemetry initiatives, ensuring projects automatically generate metrics and logs.
- Simplified container deployment pipelines, reduced tech debt and led company-wide shift from Docker to Podman, saving ~70,000 hours of compute weekly. This set the standard for rootless OCI image builds at Bloomberg.
- Independently led projects outside core responsibilities, in which I built:
 - A VSCode plugin that replicates CI locally which is enabled company wide; leveraging Bubblewrap to share production caches resulting in local and remote builds speedups.
 - The company's first JSONSchema store to enable autocomplete and syntax validation for our internal configuration files. Enabled company wide.
 - A secure Postgres frontend with in-browser credential encryption, akin to Superset.
 - A widely-used browser plugin linking repos to logs, deployments, and more – one of the company's most starred internal projects, with over 500 daily active users.

Fixed Income and Electronic Trading | Software Engineer

Oct 2019 - Feb 2022

- Worked on and modernised a key trading system used for trading bonds in secondary markets across emerging markets. This involved C, C++, Redis, Kafka, Zookeeper and messaging queues.
- Led a zero-downtime re-architecture of the central legacy monolith from C to modern C++.
- Independently improved developer experience of team through faster builds and better local workflows. Contributed these improvements org-wide, leading to the next role in DevEx.

Internship

Mar 2018 - Sep 2018

- Re-architected a client-side codebase as a service layer to improve its extensibility and reliability.

Education

Imperial College London

2015 - 2019

Computing MEng, First Class Honours

- Dean's List, Year 4, 2019 (Top 10% of Cohort)
- Dissertation: A Practical Analysis of Optimisation and Recovery Under Uncertainty: [link](#)
 - Distinguished project (Score of 91%)
 - Dissertation awarded NewVoice Media Prize for Computing
- Microsoft Project Prize runner-up (Year 3), IBM Project Prize runner-up (Year 2)
